Papers published in this periodical are written by faculty members of the Kansas State Teachers College of Emporia and by either undergraduate or graduate students whose studies are conducted in residence under the supervision of a faculty member of the college.
Simulation, Role-Playing, and Sociodrama in the Social Studies

by

Dale M. Garvey

I. INTRODUCTION

It is a truism that the world is becoming increasingly complex, and that each social group is increasingly interdependent upon the actions of other groups for the satisfaction of many of their mutual requirements. It is equally true that the American educational system must bear a major portion of the burden of preparing the young to assume their appropriate role in the society. To accomplish the goal of providing adequate preparation for the young suggests the need for widespread adoption by the educational system of techniques which will enable the student to gain some laboratory experience of life in order to appreciate the complexity and the interdependence of the real world.

It is such techniques that are the concern of this paper. Research and experimentation have demonstrated that simulation and its associated techniques of role-playing and sociodrama afford the young student a valuable laboratory experience, and one that an overwhelming majority of students enjoys. The purpose of this paper is to present a few suggestions for the employment of the techniques and to provide a selected bibliography concerning the theory and the application of role-playing, sociodrama, and simulation.

Social Studies and American Education. The American educational system receives perhaps more than its share of blame for its inadequacy in preparing its students to recognize the interdependency of the social systems of the modern world, as well as its failure to provide adequate preparation for the increasing demands and opportunities of life. American schools have no task more important than that of assisting the young to acquire the social learnings and competencies which will en-

Garvey, "A Preliminary Evaluation of Simulation" (paper read at the 46th Annual Meeting of the National Council for the Social Studies, Cleveland, Ohio, November 26, 1966). (Mimeographed.)

able them to function as responsible and effective members of the society in which they live.3

However, the young cannot be educated primarily for facing only the situations of the immediate social grouping in which they live. Their lives are now and henceforth will be inextricably intertwined with those of the entire nation as well as with those of the world community. The task facing American education requires not only adequate and accurate substantive information about the world, but it also demands the use of learning methods by which the student can be helped to relate himself to others who live differently and who have different values, or to learn to manipulate the social structure in a manner in which it is most likely to fulfill his requirements and simultaneously effect the least disruption to the aspirations of others.

To provide a social laboratory, three techniques may be employed. Each of the techniques is based on role-playing. They range from the comparatively simple to the highly complex. Each requires the student to perform a role which he is not accustomed to playing, and thus requires him to relate himself to the problems and attitudes of other individuals. In the performance of the other-role, the student acquires an awareness of complex interactions which he could receive in no other manner than actual exposure to the situation depicted. At best, actual exposure (even if possible) would be expensive in terms of time and cost, and it could be highly hazardous to the life or the future of the student.

Each technique (role-playing, sociodrama, and simulation) requires the student participant to assume an identity other than his own, similar to the manner in which an actor assumes the identity of another. Each technique possesses its unique advantages in reference to the other two. There is some overlapping of the techniques, as the most simple of the three—role-playing—is also an essential element of sociodrama and of simulation. In effect, the three techniques are related through the use of role-playing as a fundamental action, and sociodrama and simulation are more complicated techniques which employ the fundamental technique, adding additional elements which make them more suitable for the intermediate and secondary grades.

The question is frequently asked, “Are these techniques effective teaching methods?” Obviously, no definitive answer is possible, because the effectiveness of any technique depends upon a multiplicity of factors, including (but not limited to) the ability of the teacher, the abilities and the interests of the students, the physical setting of the classroom, and the attitudes of the school administration, the faculty, the students, and the surrounding community. It is possible to provide a partial answer to such a question, however, by comparing the effectiveness of one of the techniques to other teaching methods.

Simulation is the only technique of the three about which empirical evidence is available concerning its effectiveness. Experiments have been conducted concerning the effectiveness of simulation in comparison with the use of case studies and also with the lecture-discussion method. The experiments have attempted to determine, among other things, if simulation enhanced the ability of students to acquire both factual and conceptual knowledge and to retain it for a significantly longer period of time; whether simulation would develop the abilities of students to perform critical thinking; whether simulation would tend to develop in students attitudes which were more realistic in reference to current issues (as contrasted to idealistic attitudes); and whether students found simulation to be more enjoyable than the more conventional teaching methods. With the exception of indications of student interest, the results of past experiments have been inconclusive with reference to the effectiveness of the techniques in comparison with other techniques, probably because the experiments covered rather short time periods. However, each of the experiments has indicated that students find the simulation technique to be more interesting than the more conventional techniques of instruction. In one experiment involving 2,500 students, 93 percent of the junior high school students and 75 percent of the senior high school students rated simulation favorably. The response of teachers was also predominantly favorable.

Heightened student interest alone is sufficient reason to pursue the examination of the possible uses of simulation and the related techniques. The social studies are cursed with the reputation (generally deserved) of being boring and of having no applicability in the student’s life. If, in addition to being interesting, simulation should also prove to be more effective as a learning technique, its use could provide great impetus toward achieving solutions needed to help the young to recognize and to relate to the interdependence of the world community.

This paper seeks to provide information concerning how the techniques can be used to help students achieve understanding. It also seeks to describe the similarities and the differences among the three techniques.

Some authorities make no attempt to differentiate between the techniques of role-playing and sociodrama, or between simulation and gaming. It appears desirable, however, to discriminate among the terms. In order to achieve some discrimination, in this paper the terms

---

5For a brief review of some experiments and their findings, see Cleo Cherryholmes, “Some Current Research on Effectiveness of Educational Simulation: Implications for Alternative Strategies,” American Behavioral Scientist, X (October, 1966), 4-7. See also Garvey, op. cit.

6Hall T. Sprague and R. Garry Shirts, “Exploring Classroom Uses of Simulation” (La Jolla, California: Project SIMILE, Western Behavioral Sciences Institute, 1966), pp. 6-7. (Mimeographed.)

are treated as individual techniques. They are grouped together and discussed in this paper because of their shared similarities:

1. Each one utilizes a symbolic model.
2. Each one requires the student to define the problem, to determine the available alternative solutions and the possible consequences of those alternatives.
3. Each one enables the student to receive practice in decision-making in a situation devoid of danger if an incorrect judgment is made.⁸

II. DEFINITION OF TERMS

Frequently, the terms role-playing, sociodrama, and simulation are used in a manner which tends to confuse. In this paper there is an effort to distinguish between each of the terms in order to impart greater discrimination to each one. Other related terms are also defined in the interest of clarity.

Role-playing is the simplest form of activity represented by the three terms. Role-playing is the practice or experience of "being someone else." It is employed to enable a person to attempt to understand the situation of another person, or it may be a fictitious role in which the player is seeking to acquire an understanding of relationships or of actions.

Sociodrama is the employment of role-playing as a means of enabling the role-players to seek a solution to a problem. Sociodrama involves a situation to which an acceptable solution must be devised by the actors or role-players. The situation utilized in sociodrama is usually a comparatively simple verbal model which may or may not depict an actual situation.

Simulation is the most complex of the three terms. It involves the use of role-playing by the actors during the operation of a comparatively complex symbolic model of an actual or of a hypothetical social process. Except in the simplest models, simulation usually includes gaming. Simulations may be all-man, man-computer, or all-computer operations. The references in this paper are almost entirely concerned with all-man simulations.

Model is a term utilized to designate a set of interrelated factors or variables which together comprise elements which are symbolic of a social system. The variables utilized are limited to those which are necessary to ensure that the model will function in essentially the same manner as the actual or the hypothetical system would function, i.e., that the model will possess a degree of likeness to reality, or isomorphism. Symbolic models may be either verbal or mathematical. The materials referred to in this paper are concerned almost entirely with verbal models.

⁸Shaftel, op. cit., p. 9.
Social Process is a term denoting a method involving a number of steps or operations by which the members of a society establish goals and seek to achieve them. The goals may be well-defined or comparatively obscure. The members of the society seek satisfaction of their desires by employing competition, cooperation, and conflict. The application of this method to the resolution of issues involved in the area of human activity generally labelled "political" is designated a political process.

System refers to a portion of a total society in the same manner that "circulatory system" is used to label a portion of the total human body, or of a frog, etc. The term refers to a set of interrelated parts or elements, each of which affects each of the others and is affected by each.

Gaming refers to the application to simulation of situations demanding the development and choice of strategies, or decision-making, and some type of payoffs—rewards or deprivations dictated either by chance or by the choice of strategies. The decisions and the rewards are subject to the strictures of rules known to all players.

III. CLASSROOM USE OF THE TECHNIQUES

Many teachers are hesitant to attempt to employ role-playing, sociodrama or simulation as they appear at first glance to be intricate and to pose numerous problems for the teacher who is not experienced in their use. There is no need, however, to be fearful. The techniques can easily be employed by any teacher who is reasonably well-prepared in the substance of the discipline he seeks to teach.

Role-playing is the simplest of these techniques to employ. It requires less preparation by the teacher for the particular role-playing situation than either of the other two techniques, and demands less instruction of the participants. Role-playing and sociodrama are techniques which probably are most useful in the elementary and intermediate grades.

Role-playing is an activity with which all children are familiar. It is customary for them to "play like" adults whom they desire to emulate. Little instruction is required to enable pupils to comprehend the essential elements of the situation to be portrayed. The teacher should tell a short story, possibly without an ending, as a means of preparing the pupils for the roles they will play. The pupils then enact roles which depict their concept of a satisfactory ending for the story, or perhaps demonstrate what they consider to be appropriate behavior in the story situation.

It is usually desirable prior to a role-playing session to have the pupils undergo a short "warmup" period to accustom them to a situation in which other persons will observe them. The warmup period assists the pupils to overcome some of the reticence they may feel in portraying their interpretative roles of other persons.
Role-playing is especially suitable for the lower elementary grades. The requirements for each participant are limited essentially to a reproduction of the actions which he believes another person would employ in a situation described by the teacher. The purpose of the role-playing activity is to encourage the participants to understand the attitudes, feelings, or situation of the person whose respective role they are playing. Through such activity it is hoped that both the participants and the observers will achieve a greater depth of understanding about other people, as well as about themselves.

The teacher should never express approval or disapproval of the role-enactment the pupils devise. To do so leads the children to enact roles in a manner calculated to please the teacher rather than to achieve understanding of the role. The same situation may be repeated several times as a vehicle to permit several sets of child-actors to develop understanding.

Sociodrama is a slightly more complex technique, but one which is certainly not beyond the capabilities of the average teacher. Sociodrama is utilized to enable pupils to seek, and hopefully to achieve, a suitable solution to a problem situation presented by the teacher in a manner similar to the development of a situation for role-playing. It employs role-playing, but the actors play their roles in order not only to achieve understanding, but also to develop a solution to a problem.

The use of sociodrama requires that the teacher prepare a suitable statement of a situation and of the problem or issue which is a part of the situation. The issue must be presented to the pupils in a manner which permits the participants to dramatize the situation and to envisage the role of the persons whose parts are portrayed in the sociodrama.

After a suitable warmup period, the pupils are permitted to proceed with the sociodrama in an effort to achieve both a solution to the issue and an understanding of the roles of the individuals involved in the situation. It is apparent that sociodrama is more highly structured than role-playing alone, and that a slightly greater demand is placed upon the teacher to prepare the initial description of the situation. The situation must be realistic and must be based upon information which is within the pupils' area of knowledge.

At times the teacher may desire to present to the students a situation in advance of the time the sociodrama is to be enacted. This may be desirable in order to provide adequate time for the students to research the background of the various roles to be portrayed, as well as to acquire detailed factual data concerning the situation. The prior presentation of the situation is particularly useful if the situation is a replication of an historical event or of a current situation. This method possesses the advantage that it enables the students to acquire background information concerning the characters in the situation and to interpret their roles more nearly in accordance with their historic or actual setting.

Simulation is a word that is frequently used to describe two types of activity. It is sometimes used to refer to any activity which repro-
roduces the actions of a situation whether those actions represent real life situations or are drawn from theory or imagination. In this sense, simulation would include both role-playing and sociodrama. In this paper, however, the term "simulation" is reserved for a particular technique in order to give the term a more precise meaning.

As it is used in this paper, simulation refers to an artificial situation which reproduces in essential details either a model of an actual situation or a model which depicts a hypothetical situation. It utilizes a prepared initial situation which provides some direction for the participants as they develop the unfolding process.

The conduct of the simulation is characterized by a structure of rules which limit or prescribe the actions of the players. There is usually incorporated into the simulation a game of some type in order to introduce the elements of competition, cooperation, and conflict, as these elements are usually present in real life. The utilization of a game enables the teacher to determine a winner and a loser, or sequential rankings for the various players.

Simulation incorporates both role-playing and sociodrama and usually adds a third element—a game. The participants enact the roles of persons other than themselves. They may play the parts of government officials conducting international relations, or they may act the roles of members of the United States Congress. They engage in sociodrama to the extent that the situation utilized in the simulation should be designed by the teacher to solve a problem possessing an objective which is clearly recognized by the students. This objective should concern the solution of a problem which is of the type customarily confronted by the simulated social or political organization (national government, state government, etc.) and for which the organization would be required to design a solution acceptable to an overwhelming majority of the members of the society represented. The game is the element which determines the winner or winners and the loser. (This is an element frequently not desirable in role-playing or in sociodrama.)

The three related techniques assist the teacher in providing excellent opportunities for each pupil to develop the intellectual skills of comprehension, application, analysis, synthesis, and in some instances, evaluation. In particular, simulation encourages students to seek information in reference to a specific situation represented in the simulated environment. It is not unusual for a student to conduct voluntary individual research to develop his understanding of a situation which demands a solution. In the process of attempting to further his understanding it is frequently incumbent upon the student that he apply, analyze, and/or synthesize the acquired information with that previously held by him and with information, data, and assertions provided by other participants in the simulation.

Simulation is most easily employed with students in the junior high school and the senior high school years, although it is also frequently

---

used effectively in undergraduate and graduate instruction and research. Obviously, a simulation model designed for use in the intermediate grades should not be as complex as one intended primarily for use in the higher grades. If mathematical computations are required, they should be relatively simple.

Computations are frequently required in simulations in order to calculate population growth, economic activity, or other measurements as a part of the game element of the simulation. Computations are required of the players in order for the controller (usually the teacher) to determine the progress of the play and to determine winners and losers. When computations are required, the teacher should prepare printed forms with detailed instructions concerning the information to be entered and how the computations should be performed. If the computations are too complicated they can become so burdensome that they interfere with the play of the simulation.

Simulation demands a great expenditure of energy by both teacher and students. The teacher is required to maintain a continuing acquaintance with the activities of the various players, and to be able to draw lessons from these activities which should later be called to the attention of the class. Students who engage fully in the simulation usually will devote much time to preparation for the simulation sessions. Such concentrated activity can become burdensome and many lessons which should be drawn from the simulation may be overlooked.

In addition to the lessons which the teacher can point out, simulation provides another excellent means for students to learn. Reading directions and then actually performing an act frequently demonstrate that the student did not actually understand what he read. For example, a student frequently can recite the duties of the chairman of a legislative committee or of the Speaker of the House of Representatives, based solely upon his reading of written descriptions of the duties of these officials. The attempted performance by the student, however, of the duties these officials are expected to perform frequently indicates the student's knowledge was less than complete. Requiring students actually to perform the duties of the roles assigned emphasizes their lack of knowledge, the necessity for additional study, and concurrently assists them to develop useful skills. It is excellent social training for a student to learn to perform the functions of a committee chairman or other social roles.

It is suggested that simulation be employed not more frequently than three times each week in a class which meets daily, and a frequency of twice a week is probably more desirable. The alternation of simulation periods permits the teacher and the students to utilize the other class periods for lectures, discussions, critiques and other preparation for the acquisition of knowledge and skills which may be employed in subsequent simulation periods. Also, importantly, it allows time to relate the experience of the simulation to the known theory of the simulated situation and to analyze the comparisons and the contrasts and to draw conclusions therefrom. Drawing attention to the lessons to be learned poses one of the greatest demands upon both teacher and students, and provides outstanding opportunities for learning.
The lessons to be learned must be pointed out by the teacher. The students are deeply engaged in the conduct of the simulation during the simulation periods. They are unable to observe the overall course of activities, or to draw lessons from their limited observations. Aside from the development of some social skills, simulation is of little benefit to the student if the teacher does not highlight the lessons to be learned.

It is an essential part of the simulation technique that the teacher use periods subsequent to each simulation period as a time in which to compare the simulation activities with the appropriate theory, and to indicate to the students how and when actions violated theory or failed to indicate good judgment or the application of all known information to the solution of the problem, and conversely, the teacher should carefully call attention of the students to those instances in which events were in accord with theory or in which good judgment was applied.

The criticism visualized here is not that which the teacher was cautioned to avoid in the use of role-playing. This criticism is not approval or disapproval of the solution based on the teacher's personal values. The criticism is based on a comparison of the actions of the players with the accepted theory of the particular social process being portrayed. The teacher must still avoid indicating that a solution is or is not in accordance with his personal preference for the same reasons that such approval or disapproval should not be indicated in role-playing.

The use of a critique following each simulation period requires that the teacher possess adequate preparation in the substantive area represented by the simulation. For example, if the simulation reproduces the conduct of relations among nations, the students of a teacher with no preparation in international relations and foreign policy would experience great difficulty in extracting from the simulation any rewarding insights into the theory of international relations and the formation of foreign policy decisions by governmental officials.

IV. THE DEVELOPMENT OF SIMULATION MODELS

To the beginner, the construction of a simulation model appears to be a task of imposing complexity and doubtful success. The results of an attempt to construct a model, however, are well worth the effort. It is almost impossible for a teacher to perform the research required for the construction of a model and to fail to acquire greater depth of understanding of the process chosen for simulation.

Although some simulation models are available commercially, there is considerable value derived by the teacher if a model is constructed for the specific uses envisaged in the teacher's unit plan. The teacher can prepare a model which meets the particular needs of the specific class. Because of the research performed in preparation, the teacher will gain increased understanding of the particular social process or historical situation which is chosen for simulation. A teacher may begin with relatively simple simulation models and progress to more complex models as he gains competence and confidence.
The initial step in the construction of a simulation model is the selection of the social process which is to be reproduced. The teacher must have specific objectives in mind, and the process to be duplicated must illustrate those objectives if the maximum value is to be obtained from the simulation. The objectives may be, for example, to demonstrate the importance of leadership and compromise in the operation of a democratic political system.

An historical or a current situation may be selected which provides an excellent example of leadership and compromise in operation. For example, the events which culminated in the Constitutional Convention and the Convention itself are excellent instances for the demonstration of both qualities. Or a hypothetical situation may be designed which will provide the necessary setting.

The replication of current or of historical situations and of hypothetical situations possess their respective advantages. A replication of a current or of an historical situation may be used to demonstrate pressures or other causes for the historical process or the current process. It may also be used to permit the students to determine if they would have reacted in the way that real actors reacted in the actual situation. The latter use enables the students to develop insights into the factors which affect decision-making and enables them to understand some of the problems involved in the process of arriving at political decisions.

Hypothetical situations may be developed which are designed to illustrate particular elements of theory or to develop specific skills which the students should possess. A hypothetical situation may also be created to reproduce in microcosm the essential elements of an actual situation and yet the situation depicted may not be entirely in accord with actuality. This type of situation not only enables a teacher to demonstrate particular processes, skills, and pressures which are present in a social process, but to present them in a manner which removes the student from the emotional attachment he might possess if the actual situation were replicated. For example, in developing a simulation of international relations it would be quite difficult to have a simulated Russia populated by American students and to have the decision-makers of the Russian nation react in the way that Russians would normally react. This is a practical unlikelihood because of the emotional involvement which Americans customarily possess in reference to understanding Russian policies and objectives.

When emotional reactions might prove undesirable in a situation, for example in a situation involving international relations, it is usually desirable to create a hypothetical situation which would possess the essential characteristics of the actual situation. For example, in a situation involving the United States and the USSR the two could be designated by fictitious names in order that the pupils could not readily identify the countries which were replicated.

After the selection of the process which is to be portrayed and the determination whether the situation is to be hypothetical or a replication of actuality, the next step is for the teacher to research the situation in depth and to develop an understanding of the essential elements of the
process which is to be replicated in the simulation. For example, in a simulation depicting how American foreign policy is developed, the model would probably include elements representing the role of the President and his principal foreign policy advisors, the Congress (the Senate in its role of giving advice and consent as well as the possibility that the House of Representatives might be included as it participates in providing the necessary financial support for foreign policy), plus the competing pressures registered by various pressure groups and news media. Some method might be employed to insert into the simulation the pressures which are generated as a result of the relationships which the United States maintains with other nations and the likely conflict of objectives among nations.

Care should be exercised to insure that only the essential elements of the situation are built into the model. If extraneous elements are utilized they may obscure the process sufficiently that the student will not be able to recognize the actions which are taking place and the reason for those actions. The inclusion of unnecessary elements also makes the construction of the model a more complicated process.

One of the difficult problems to overcome in the design of a simulation model is to develop some means by which the relationships of the various elements of the simulation may be made realistic. It is impossible, for example, to quantify the power which is possessed by the President and the Congress in their relationships. Usually we merely refer to a comparison of the power which each possesses and say that "the President is more powerful than Congress" or a similar expression of a relationship.

In a simulation, however, it is more useful to have some way by which the players may measure with some precision the amount of power which each actor possesses. This is desirable because the students do not possess adequate information concerning the relative power of the elements in the simulation model and they are able to operate more effectively if some means is provided for gauging the relative power of the respective elements. Each element of the model may have units which correspond to power. Such units may be designated as units of Persuasive Capabilities, Basic Capabilities, Military Capabilities, etc.

The devices used in the construction of the model to give an impression of the relative power of the various elements are limited only by the imagination of the teacher. The units provide a basis not only for developing in the students an understanding of the comparative strengths of the elements (or the various players) but also provide a basis for the development of the game situation to be incorporated into the model.

The game is one of the most difficult elements which the teacher will encounter in the design of the simulation model. The application of a little ingenuity, however, will indicate numerous game possibilities. Games may be constructed with the use of specially designed playing cards or with the use of tokens such as paper slips representing money or elements of power, or poker chips may be used.
Numerous commercial games are available which will provide the teacher with ideas which may be adapted to the simulation under design. For example, the game Monopoly is a simple reproduction of an actual social process, and utilizes tokens, cards, and dice in the development of the play. Another game, Risk, is a greatly simplified version of international relations in which each country attempts to become sufficiently powerful that it may rule the world. A familiarity with games such as these will be of great assistance to the teacher in the development of a simulation model which portrays accurately the social or political process which it is desired to simulate.

A useful method by which to begin a design of the model is to write a description of the social or the political process which it is desired to replicate. The description should contain all of the detail which it is desired to include in the final written model. Of course, the first draft will be unsatisfactory and it will be necessary to add and to delete many items which were or were not in the first draft of the model. After the descriptive model is completed it may be expanded to include directions for players and any necessary rules for the conduct of the game included in the simulation.

One convenient way to proceed with the design of the model and to begin the incorporation of the game elements is to read simulation models which have been developed by other persons. Many of the models referred to in the bibliography of this pamphlet will prove very useful to the teacher designing his own model. It is emphasized that straight copying constitutes plagiarism whether or not the model has been copyrighted. Therefore, each model designed should be the work of the individual doing the design, but there is no harm in obtaining ideas for refinement of the model by reading models which have been designed by other people.

It is necessary to be on constant guard to avoid making the simulation model either too simple for the students for whom it is intended or much too complex. If the model is too simple, the students will not find the simulation challenging and it will be a boring experience. If on the other hand the model is too complex, it may not generate interest in the play of the game and the students may well become so involved in the mechanics of the simulation that they are unable to spend adequate time in the conduct of the simulation for the objectives which the teacher originally designed the model.

After the first draft of the model has been completed, it is useful to have another teacher or other person read the simulation and determine whether it is easily understood and if the procedures outlined in the model are realistic according to the known theory. The person chosen to assist should possess an adequate background of the substantive knowledge of the process which is being replicated. It should not be

---

10For one example, Cleo Cherryholmes and Harold Guetzkow have developed an Inter-Nation Simulation kit, published by Science Research Associates, Inc., which is useful at the high school level. For another, the author has developed (and is currently revising and expanding) a simulation of American national government. The latter has been used at the high school level and experimentally in the seventh and eighth grades.
an occasion for deep depression if the individual reads the design, states
that a number of points require clarification or violate the known
theory. No model is adequate or accurate on its first draft. A satisfac-
tory model is achieved only after repeated rewritings and only after
it has been tested in the classroom.

After the initial design has been rewritten the model should then
be prepared for presentation to the class. It should not be considered
to be completed at this point, however. Only after several classes have
used the model may the teacher find those portions which need to be
redesigned. In fact, it is unlikely that a model is ever completely
satisfactory.

It is worthwhile reiterating a point concerning the complexity of the
simulation model. Not only should the model be of sufficient simplicity
that the students can operate it satisfactorily, but for the benefit of the
teacher the initial model to be constructed must be relatively simple.
An attempt to construct a complex model on the first effort is more than
likely to result in despair and frustration.

A method which may be used is first to construct a relatively simple
model; for example, a model of the operation of the United States
Congress. After gaining experience in this attempt, an elaboration of
the first model may be constructed. This might constitute another
subsystem of the process replicated in the first model. For example, the
second model might introduce the operations of the committee system
of the Congress. A third model might then be constructed which would
provide a working model depicting the relationships between the
Congress and the President. Additional modules could be constructed
which would depict the operation of political party nominating conven-
tions, national elections, and selection of the presidential cabinet. These
modular models would thus provide a series of simulations around a
central theme.

V. THE DEVELOPMENT OF SOCIODRAMA SITUATIONS

In some situations a teacher may find that it is of more value to em-
ploy a less rigidly structured situation than is usually presented in a
simulation model. In such instances the teacher may well find that the
use of role-playing is of considerable value in presenting opportunities to
the student to acquire understanding of decision-making processes, and
of pressures which underlie decisions.

At the secondary level, the role-playing or sociodrama situation can
be considerably more complex than that which is employed in the
elementary grades. The employment of sociodrama and the situations
in which it is useful are limited only by the imagination of the teacher.

For example, during the study of almost any social process there are
appropriate times for the employment of either sociodrama or of simul-
tation. The use of sociodrama enables the teacher to enliven the instruc-
tion and to require the students to become more personally involved in
the learning process.
Sociodrama has an advantage over simulation in that it can be used for relatively short periods of time, and it does not require the extensive preparation which is needed to introduce a class to the use of simulation. When simulation is introduced to a class it is necessary to instruct the students in the rules of the game itself, i.e., the manner in which the simulation is operated. In introducing sociodrama, however, there is only a requirement for an introduction of the situation and the students may then proceed to enact roles which are relatively familiar to them based upon their study and experience.

One of the major advantages of sociodrama is that it provides a teacher a relatively simple method to enliven the teaching of the social studies. It permits a departure from the more traditional lecture-discussion method and there is a strong tendency for the student to feel a demand for additional self-preparation if he is aware that he is likely to be called upon to participate in a sociodrama.

It is not necessary for the teacher to announce that a sociodrama is to be conducted in the future. However, if short sociodramas are used occasionally, students are more likely to be prepared to participate in the enactments and therefore they are more likely to draw additional understanding from the sociodrama situations.

The fact that sociodrama is a less complicated technique than simulation enables the teacher to employ a less highly structured situation than would be necessary in simulation. This fact does not, however, permit the teacher to be less knowledgeable concerning the process which is replicated in the sociodrama. The advantage from the point of view of the teacher lies in the simplicity of the situation which he must prepare in order for his students to enact the roles they are to portray.

To employ sociodrama a teacher should begin at the time of planning the unit to locate those elements of the unit which will lend themselves to the employment of sociodrama. After this has been done, the teacher should then perform sufficient research to ensure adequate understanding of the environment, the social processes, and the pressures which operated in the situation which is to be depicted.

After completion of the research, the teacher should then develop a verbal model (a detailed description of the process which the students are to play in the sociodrama). The model is similar to that developed for a simulation model except that it is usually less complex, and does not contain a game element.

Frequently, there is no requirement for a formal preparation and written statement of the situation. The teacher may retain the research notes in the unit plan file and simply present orally to the class the situation which is the background for the sociodrama. The situations may be very simple and present a minimum of information, thus forcing the student to draw upon his own reading or background information and his problem-solving ability to develop a satisfactory solution to the situation posed in the sociodrama or the situation may require the student to perform research in order to acquire adequate background for operating in the sociodrama.
If no time is provided for preliminary research, it is desirable to present the situation to the entire class prior to the announcement of the names of the students selected to play the various roles in the sociodrama. This tends to center the attention of the entire class upon the preparation of the situation. After the situation has been announced, the name of the students to play the various role are then announced and they are given a few moments in which to prepare for the enactment of their roles.

Students should be made aware that adults and the young both enact roles in the normal conduct of their daily lives. Each individual plays several roles, depending upon the functions which he fulfills. All roles, of course, are not played simultaneously. The various roles are portrayed as the individual seeks to accomplish the various functions he is expected to perform (or which the individual expects himself to perform.)

A man may perform the role of a father, a husband, a son, a brother, a father-in-law, a member of one or several civic, service, religious, or fraternal organizations, and that of a professional man, wage earner, or other economic role. All of these roles (and others) may be played more or less concurrently over a period of time. For example, it is conceivable that during one day a man might perform the functions expected of a father, a husband, a member of one or more organizations, as well as those functions which would normally be expected of him in the performance of his job or his profession.

Each individual will perform the functions of the various roles in response to several pressures. Although the terminology has not yet been standardized, there is general agreement that the behavior in each role is the result of responding to the role-player's own ideas of what is appropriate (role cognition), to other people's ideas of what the role-player will do (expectations), and to other people's ideas of what the role-player should do (norms.)

An understanding of roles and the manner in which people determine what their actions will be in each role, will assist students to understand better how they should prepare for their participation in the role they are to enact in the role-playing, sociodrama, or simulation situation.

By assuming the roles of others, students acquire a better understanding of events in history, methods of government, conduct of international relations, and problems in social relations than is the case when more conventional methods of instruction are used. This technique, when used as a supplementary teaching method, enables students to handle controversial issues in a realistic fashion, encourages critical thinking, releases imagination, and is conducive to attitude change.

Sociodrama situations usually, of course, reproduce situations in which conflict occurs. It is often advantageous to select for the roles

---

to be played in the sociodrama those students who hold attitudes which are contrary to the positions of the characters whose roles they will portray. Students will usually make an honest attempt to reproduce the attitudes of persons whose roles they enact. Even though the attitudes of those persons are contradictory to the personal attitudes of the student, playing the "devil's advocate" is frequently beneficial and enables the student to obtain a deeper understanding of pressures which cause a real-life actor to play a role which is not consistent with the attitudes or desires of the student. Even though the student may not be convinced of the adequacy of the position which he portrays he will usually develop a greater awareness and appreciation of the differences between his position and one which differs.

VI. CONCEPTS AND OBJECTIVES

Prior to the development of a situation for use with any one of the techniques discussed here, it is essential that the teacher determine what objectives and concepts are to be selected as goals. As used here, objectives and concepts have entirely different meanings.

The term objectives is intended to designate the ways in which students are expected to change their thinking, their feelings, and their actions. Concept as used here refers to a framework of understanding into which are fitted facts, relationships, and processes in their appropriate relationship with the other elements of the concept. The term connotes that among the elements of the concept there exists an interrelationship that approaches the meaning of "law," but the relationships are not sufficiently precise, constant, nor measurable to qualify as a law.

Concept infers a depth of comprehension which surpasses the mere accumulation of facts and the ordering of those facts into a classification. The term here assumes that one acquires a concept when he is capable of comprehending the subtle interrelationships of the elements constituting the concept, and is capable of applying the concept to the solution or the comprehension of other appropriate arrangements of similar elements.

The objectives and concepts which are the goals of the simulated situation must be clearly visualized during the construction of the situation. The use of role-playing, sociodrama, or simulation without careful attention to the objectives to be achieved and the concepts to be comprehended, is a waste of time. The techniques should not be employed for their entertainment value.

14It is recognized that the term "concept" is given many different meanings. Kaplan, in The Conduct of Inquiry (San Francisco: Chandler Publishing Company, 1964), discusses various meanings and implications of the term in Chapter II. Although Bloom does not appear to define the term, he employs it apparently as a synonym for "generalization," see Taxonomy of Educational Objectives, Handbook I, p. 122.
The objectives of the unit should be established precisely. The objectives may be taken from the listing of intellectual abilities and skills as classified in Bloom's *Taxonomy of Educational Objectives*. No matter what objectives are selected, they should be stated in the unit plan and the simulation activity should be designed to assist the teacher in ensuring the accomplishment of those objectives by the students. The following might be objectives in a sociodrama or a simulation situation:

1. To develop the ability to work effectively in committee.
2. To enhance the knowledge of and develop facility in the use of parliamentary procedure.
3. To develop understanding among the students that those who hold differing attitudes are not necessarily disloyal to the political system.
4. To develop the ability of the student to analyze the arguments presented by those holding differing attitudes, to recognize the weaknesses of those arguments, and to revise his own argument in order to counter the argument of his opponent.

The concepts which would be included in the unit would be those which could be developed from the subject matter of the unit. For example, in the objectives outlined above it is apparent that the unit involves some type of committee activity, probably involving political issues. Concepts which might be used in conjunction with those objectives might be the following:

1. A political system performs no function until demands are placed upon the system by its citizens or subjects.
2. It is customary to find competing desires in a political system. Conflict is a natural outgrowth of competing desires.
3. Dissent is one manner in which conflict becomes apparent. A person can dissent without being treasonous, provided he consents to conduct his dissent within the established forms which the political system has provided for seeking to accomplish change, e.g., by elections, operation of pressure groups, and court decisions.

If the objectives and the concepts are carefully selected and precisely stated; if the process to be replicated is sufficiently simple for a first attempt; if the research is performed carefully (and arduously); and if the descriptive verbal model is written with care, rewritten with understanding, and rerewritten (with exasperation) any teacher with a reasonably adequate preparation in the substance of his discipline should produce a simulated situation which his students will find interesting and valuable. In addition, the teacher will find a greater understanding of the social process he has chosen for replication, and a sense of satisfaction for having provided to his students a challenging learning experience.
An Annotated Bibliography of Simulation, Role-Playing, and Sociodrama in the Social Studies

by

Sancha K. Garvey

The bibliography contains materials about simulation and the related subjects of sociodrama, role-playing, and gaming in forms that should be useful not only to students who are learning to be teachers of the social studies but also to teachers who are already in classrooms. Since this is a selected list, it does not purport to include everything of value available on the subjects covered but is sufficiently complete to give the student a good foundation. The annotations are not meant to be complete reviews but only guides to help one using the bibliography find information that best suits his needs. In making selections, an attempt was made to include materials for both the beginning and the advanced student.

The entries were selected with three purposes in mind: (1) to give the teacher background information about the theory of simulation and the related techniques, (2) to present concrete examples and instructions concerning its uses, and (3) to provide sources of materials which will enable him to analyze a political process and to construct a verbal model.

The bibliography is divided into sections corresponding to the purposes outlined and arranged alphabetically by author with periodical articles, books, and other entries together. The first section, headed "Theory," contains materials which provide a general background concerning the learning situations in which either simulation or role-playing is likely to be useful, and the rationale for their use. The second section, "Application," describes experiences and the results of experiments with role-playing and simulation as a learning technique. The last section, "Analysis and Model Building," is confined to a few suggestions which will assist the teacher to conceive of a "political system," to analyze that system and to construct a verbal model in preparation for staging his own simulation.

**Sancha K. Garvey and her husband, Dale M. Garvey, have devoted much of the last five years to a joint study of simulation, role-playing, and sociodrama in the social studies. Mrs. Garvey received her Master's degree in Librarianship at Kansas State Teachers College, Emporia.**
BIBLIOGRAPHY

I. THEORY

A compilation of some ideas and conclusions of writers who have studied the concept of roles people play, with the material presented in a manner that shows how these roles are interrelated.

A study of the classroom and the roles played by members of the group. Theory given here could be applicable to students trying to solve problems in social study classes with the use of sociodrama. Author is Director of Human Relations Center and Berenson Professor of Human Relations, Boston University.

A university professor points out how he has used dramatic role-playing in college sociology classes. Gives theoretical background and advantages with the suggestion that the method be widely used in all fields where people want to understand each other.

This discussion of the effects for children of active participation in the learning process should stimulate both classroom teachers and researchers. Author is Professor of Psychology and Co-director of the Center for Cognitive Studies, Harvard.

Points out problem, when applying game theory to politics, of knowing all factors involved and being able to make value judgments within a reasonable time.

Presents a good thesis for using sociodrama with its emphasis on the need for decision-making teaching methods in social studies classes. Author is Associate Dean for Graduate Development at Indiana University and a member of the Board of Directors of the National Council for the Social Studies.

A summary of findings from an exploratory study of the use of sociodrama in education, which presents an excellent discussion of theory.

Discusses a study of a historical situation as a method of validating a simulation using events leading up to World War I as an example.

Transcribed from a talk delivered at the Social Studies In-Service Institute, Hawaii Department of Education, August 4, 1965, at the University of Hawaii, in which teachers were encouraged to give students an opportunity to understand the playing of roles in life by providing activities in the high school that further that understanding.

A sociologist's explanation of the distinctions between psychodrama, sociodrama, role-playing, and social drama.

A layman's introduction to game theory written in an interesting manner and illustrated with cartoons.

Moreno, Jacob L. The Theater of Spontaneity; translated from the German Das Stegreiftheater. New York: Beacon House, 1947.

Sociodrama was first defined in the German edition by its originator, the author. Breaks new ground for the educator in the field of spontaneity theory, play technique, and interpersonal communication.

An explanation of the growth of the various sociological theories of the author. See pp. 87-89, 531-547 for excellent discussions of sociodrama and the theory of “spontaneity learning.”

Points out importance of recognizing areas of human conflict in social science courses and of choosing methods of handling them in which outcomes probably are predictable.

An introduction to the theory of games for the general reader and for the social scientist, requiring only very little more mathematics than high school algebra for understanding.

A book of selected readings for the social scientist and intelligent layman concerning gaming and game theory with emphasis on application rather than methodology. Excellent for the student who wants to explore in depth the relationship of game theory and simulation.

An excellent sociological analysis of the major types of "role-taking" behavior in relation to concepts of "empathy" and "reference groups." Author is Chairman of the Department of Sociology at the University of California, Los Angeles.

**II. APPLICATION**

Advice from a teacher who has used role-playing in his classes.

The final report of a project comparing results of using a form of simulation and case studies in teaching 134 undergraduate political science students at Northwestern University in 1962-63.

Evaluation of "war games" played in Contemporary Thought classes in Lyons Township High School, La Grange, Illinois, which started with the accidental bombing of Hanoi by an American plane. Includes reactions of students.

A brief report of a series of experiments in political gaming in international affairs at M. I. T. with information about organization for playing.

Boocock, Sarane S. "Effects of Election Campaign Game in Four High School Classes." Baltimore: Department of Social Relations, Johns Hopkins University, 1963. (Mimeographed.)

A report of a man-computer election game stating that students seemed to show a more realistic attitude toward politics after participation in the simulation exercise.
An Experimental Study of the Learning Effects of Games with Simulated Environments,” American Behavioral Scientist, X (October, 1966), 8-17.

Report of data from a study of the Career and Legislative games played at Berkeley, California, in 1964, in which the author points out that the participants showed an increase in role empathy, in their ability to cope with factual information, and in their feeling of efficiency.

Describes three Johns Hopkins games and outlines an experimental design for testing effectiveness of gaming.

Explains value of role-playing in solving social problems and in teaching the social sciences, with explicit examples of its use.

Report showing favorable attitude of high school students toward a simulation exercise in international relations.

Reports the effectiveness of six simulation studies in the classroom with suggestions for making the method more valuable.

Christine, Charles and Dorothy Christine. “Four Simulation Games That Teach,” Grade Teacher, LXXXV (October, 1967), 109-120.

Description of four simulation games used in the sixth-grade classroom to teach concepts of inflation, production line efficiency as compared to that of the independent maker, problems in world trade faced by land-locked nations, and the relationship between parent and satellite nations, with full explanation of rules, procedure and evaluation for all four games.

Lucid explanation of the use of simulation in an intermediate-grade social studies class to demonstrate a concept in international trade relations, in which the exact method used, rules of the game, and results are all discussed.

A presentation of the social climate found in the ten high schools chosen for analysis in a research project sponsored by the U. S. Office of Education and the Ford Foundation, with an indication of the implications of the findings on education in modern society. Most important for the study of “gaming” as a teaching tool is Chapter XI, “Adolescence and Secondary Education in Modern Society,” pp. 311-329.

Explains reason for sociologist’s interest in games as an opportunity to learn about social organizations from observing their actions in a “caricature” situation and also as a means of teaching children about such situations.

In section, “Opinions Differ,” Coleman points out importance of games and describes some of those developed at Johns Hopkins. Kraft deals with their discrepancies.

A collection of studies about simulation that presents the views of some of the scholars who have done recent research in the field.

Special attention should be given to pp. 133-137 in which the value of sociodrama is discussed and suggestions are given for its successful application in a social science classroom.

Deals with method in which sociodrama was used in a senior high school class to give students more insight into their personal problems. Also mentions use of sociodrama for studying racial problems. A good guide for sociometric and sociodramatic techniques.

Garvey, Dale M. “A Preliminary Evaluation of Simulation,” a paper presented at the 46th Annual Meeting of the National Council for the Social Studies, Cleveland, Ohio, November 26, 1966. (Mimeographed.)

A report of five experiments involving use of simulation in the classroom and a synopsis of their conclusions presented by a professor of political science at the Kansas State Teachers College, Emporia.

Report compares the effectiveness as a teaching technique of simulation and the lecture-discussion method.

In this game, a unit on the American labor movement in United States history, the stage for action is set with a simulated radio report by the teacher, the full content of which is included. Author is the high school social science consultant in the Chicago Public School System.

A defense of the author's game, War or Peace, in which he points out that oversimplification results in distortion but that 9th grade students can compensate for unreality in a classroom game (see Kaplan, Alice J. and Martin S. Gordon entry in bibliography).

See pp. 187-202 for explanation of sociodrama and role-playing with explicit examples of roles that have been played and suggestions for setting up such activities.

Examples given of suggested problems for sociodrama with a step-by-step explanation of procedure as outlined originally by the California Council on Improvement of Instruction.

An interesting history of gaming in which a retired general presents information about the use of games in the development and testing of both political and military strategy. Written for the layman.

An excellent discussion of the problems in the presentation of controversial issues to various types of classes. Role-playing is suggested as "one of the most promising techniques" to bring about understanding of one's fellow citizens.

A collection of readings about the use of man, man-computer, and all-computer simulation in the fields of economics, political science, psychology, and sociology compiled as an aid for teachers, students, and laymen in helping them understand the use of simulation as a technique in the study and teaching of the behavioral sciences.

Gives a lucid description of an actual man-computer inter-nation simulation in the laboratory of a classroom which should be extremely valuable to social science teachers. The researchers should benefit by the excellent explanation of the theory embodied in the simulation. Author is Professor of Political Science, Psychology, and Sociology and Co-Director of the International Relations program at Northwestern University.

Simple description of International Simulation at San Diego Navy Recruit Training Station, later used in California’s San Dieguito High School. Points out how “articulating subject disciplines can be truly integrated.”

Report of a simulated national crisis demonstrated at the DAVI convention, 1966, in San Diego, by Hall Sprague of the Western Behavioral Sciences Institute, La Jolla, California. Author is Professor of Education, Indiana University, Bloomington.

A discussion of a year’s experimental work in community sociodrama conducted in classes at the University of Denver. Material presented here is practical and could be helpful to anyone wishing to use sociodrama techniques.

A study in which the group effects, the ability of the game administrator, and the predisposition of the players are observed in relation to their effect in the playing of simulation games.

An outstanding sociodramatist presents her theories with practical illustrations.
A modified form of sociodrama used in a history classroom. Based on the all-night session of the French National Assembly on August 4, 1789.

Discussion of John D. Gearon's War or Peace game (see Social Education, XXX (November, 1966), 521-522) pointing out fallacies in its structure and putting emphasis on presenting complex processes in a meaningful way.

Author cites examples used in his classroom for dramatization and points out necessary steps in teaching procedure.

See pp. 118-120 for a very specific explanation of role-playing and sociodrama theory, examples of how it can be used in various social studies classes, and a list of its advantages.

Discussion of strategies of revolutionary conflict in a simulation model when the number of possible gains on each side is not fixed.

Explanation of the development of the manufacturing unit of the High School Geography Project by a psychologist and a geographer in an attempt "to arouse students' enthusiasm about geography as a scientific subject and impart scientific attitudes of respect for objective evidence, tentativeness in drawing conclusions and accepting theories, and skepticism about one's pet developments and ideas." Unit explained and evaluated.

A discussion of role-playing and its importance in teaching decision-making at any level.

A study using the Harvard Management Game as a basis for judging how much influence variations and ability in administrative technique can affect the performance and attitudes of students participating in simulation games.

A lucid and highly useful guide for the primary teacher who is interested in role-playing theory, application, and teaching techniques. Describes year's work with the method giving examples and explicit explanations of their use plus an evaluation at the end of the year.

A report of an experiment in which the interest and the involvement of students participating in a simulation exercise and in the use of case studies were compared.

A study using the Parent-Child game to show that behavior is shaped by the reinforcement contingencies of the game, and an inquiry into the implications.

An excellent description of the situation and models for four simulations. Well-written and easily understood.

Although this article deals with sociodrama as used in an elementary school to solve personal problems, it is helpful in showing how understanding of the other point of view can be reached even in a first-grader's mind through role-playing. Examples are given.

An excellent volume concerned with role-playing in a simulated situation as a means of teaching such social science-related concepts as ethical behavior, group responsibility, citizenship, and individual integrity. Contains lucid explanations of theory, methods, and goals and has a large section of story situations that could be used in the classrooms of children through young adolescents. Very useful.

Presents theory that insight into the feelings of others brought about by problem solving with sociodrama may help students change their attitudes. Discusses actual seventh-grade situation.

Simple explanation of sociodrama, its development from Moreno's version, its potential for improving intercultural and intergroup understanding, and suggested basic steps for its use in the classroom.

Report of experiments involving 2,500 students in seventeen California schools in which it was demonstrated that students found simulation a more attractive learning experience than more conventional techniques.

Report of research by HumRRO Division No. 7 (Language and Area Training) Alexandria, Virginia, under Department of the Army Contract with George Washington University that explains the development of a simulation model of "cognitive cultural differences" to train American advisors overseas and points out why simulation was chosen as the best method for training. Much information here could be applied in a social science classroom.

A step-by-step explanation of the study of Congressional consideration of statehood for Alaska and Hawaii and how sociodrama aided those in a classroom to understand how legislators who favor a bill get it through Congress.

Report of an experiment using computers in a sixth-grade economics class in which the students played the game as individuals against the computers, enabling them to proceed with their learning at their own rate. Author points out feasibility and merit of such a system.

Although this deals only with role-playing in family relationship problems, it does point out methods of introducing the technique and the advantages derived from using it.

General suggestions about conducting role-playing in a classroom.

An excellent discussion of the capabilities, limitations, and techniques of simulation methods in teaching, using the "Jefferson Township School District" as an example. Useful to anyone interested in simulation.

Discusses procedure for dyadic role-playing and mentions several occurrences in history and various local, national, and international issues that can be studied in that manner.

One of the best guides in the field of sociodrama, a well-written, easily read pamphlet.

III. ANALYSIS AND MODEL BUILDING

Provides a method for analyzing political processes from which models can be constructed. Very useful.

Excellent background for the understanding of the organization and operation of political systems; particularly useful in the development of verbal models.

A scholarly analysis of international politics with emphasis on system and theory, which should be helpful to the advanced student in the development of models.

Chapter 9 (pp. 159-177) contains an exceptionally useful discussion of the procedures and uses of simulation. Models described in remainder of book should be helpful to the beginner in model construction.

Explains process of decision-making pointing out variables and using Korean War as an example. Could be helpful in model-making.
